ABSTRACT: OpenStack is identified as one main component in the NFV architectural framework. This liaison statement informs OpenStack generally about NFV requirements, together with an initial list of requirements currently not supported by OpenStack.

1. Overall description:

ETSI ISG NFV is securing industry consensus on business and technical requirements for NFV, and common approaches to meeting these requirements. The outputs are openly published and shared with relevant standards bodies, industry fora and consortia to encourage a wider collaborative effort. The NFV ISG intends to collaborate with other SDOs if any standardization or other approaches to encourage broad adoption are deemed necessary to meet the requirements – since one of the major ETSI NFV goals is interoperability. The NFV ISG also provides an environment for the industry to collaborate on Proof of Concept (PoC) platforms to demonstrate solutions which address the technical challenges for NFV implementation and to encourage growth of an open ecosystem.

OpenStack is invited to take note of the following initial set of NSG NFV documents:

- **NFV Use Cases**
  - describes initial fields of application. The uses cases have been selected to span the scope of technical challenges being addressed by the NFV ISG, it is not meant to be an exhaustive list.
- **NFV Requirements**
  - document describes the high level business and technical requirements for an NFV framework including service models.
- **NFV Architectural Framework**
  - document describes the high-level functional architecture and design philosophy for virtualised network functions and the underlying virtualization infrastructure. By delineating the different constituents and outlining the reference points between them, it paves the way for fully interoperable multi-party NFV solutions.
- **NFV Terminology**
  - document is a common repository for terms used within the NFV ISG documents.
- **NFV Proof of Concept Framework**
  - document. The NFV ISG has launched a global call for multi-party NFV Proof of Concepts (PoC) to validate NFV approaches and to encourage progress towards interoperability and development of an open ecosystem.
- **NFV Performance and Portability Best Practices**
  - describes a list of features which the performance and portability templates (Virtual Machine Descriptor and Compute Host Descriptor) should contain for the appropriate deployment of Virtual Machines over a Compute Host (i.e. a "telco datacentre").
- **NFV Management and Orchestration (draft)**
  - describes the management and orchestration framework required for the provisioning of virtualised network functions (VNF), and the related operations, such as the configuration of the virtualised network functions and the infrastructure these functions run on.
- Other documents may be made available as needed in future.
ETSI ISG NFV has analyzed the OpenStack capabilities; while a large number of NFV requirements can be met with currently available OpenStack features, a subset of NFV requirements cannot be met. So far two categories of ISG NFV requirements have been identified, that need more support in OpenStack, and are captured in the tables below:

- A category focused on workload performance
- A category focused the management and orchestration of virtualized resources

In addition, ISG NFV will continue this analysis and may communicate in the future additional perceived gaps (e.g. related to reliability/availability, etc).

Gaps identified focusing on workload performance are captured in the table below:

<table>
<thead>

</table>
resource catalogue information available from the producer functional block, including notification of catalogue changes

the list with types of resources from each individual OpenStack service.

NOTE 3: OpenStack’s Nova service advertises the list of VM sizes/flavours that it offers, Glance service advertises the list of images/OS available, Keystone service advertises the list of available OpenStack services endpoints/APIs, etc.

OpenStack Havana release does not provide notifications when the individual resource catalogues change or get updated (e.g., when new virtualized resources are made available for consumption to consumer functional blocks).

2. Actions:

OpenStack is invited to take note of the ETSI NFV referred documents and the initial requirement gaps in section 1. ETSI NFV ISG would welcome the emergence of a dialogue on those requirements, and would appreciate any feedback on OpenStack/NFV community to address these issues, or – even better – feedback regarding how such issues are already in progress to be addressed. In addition, ETSI NFV is interested in feedback on any topics that OpenStack community has identified as relevant in the NFV space, that may be jointly explored between OpenStack/NFV community and ETSI NFV, in order to achieve ETSI NFV’s goals.

3. Date of next meetings of the originator:

NFV#8, 18th – 21st Nov 2014, Scottsdale AZ, USA.
